

Trumansburg is a Village in Upstate New York, just north of the City of Ithaca. MRB Group is currently providing engineering design and construction phase services for the Village of Trumansburg Well and Water System Improvement Project.

The project includes a new connection to water supply wells located within nearby Taughannock Falls State Park, creating a new supply source for the Village water system.

MRB Group completed a Project Engineering Report (PER) which was submitted to the New York State Department of Health (DOH) for regulatory approval. The report was also reviewed by the State Environmental Facilities Corporation (EFC), an agency which provides funding for water projects.

The PER provided planning information for the project, an analysis of alternatives, and a scope and cost estimate for the overall project. The project will include the following components:

- Raw water lines between each well and the treatment building within the Park
- An expansion of the existing State Park treatment building to include new chlorination facilities
- New water line from the treatment building to an existing State Park storage tank
- A new booster pump station to pump water from the tank to the Village water system
- A water line from the new booster pump station
- Flow meters and system interconnections

Client: Village of Trumansburg

Location: Trumansburg, NY

Completion: In Progress

Engineer: MRB Group
